MVP

Core problem

- People are not aware of how dangerous natural disasters can get and don't prepare enough; people aren't aware of natural disasters in their area until it's too late.

Must-have features

- Notifications for nearby storms (potential tornado activity, hurricane activity and potential trajectory)
- Notifications about tectonic plates nearby and if it will affect you.
- Notifications for high-tide warnings; possible tsunami warning
- Uses location to track storms in your area
- An alarm that notifies you about a natural disaster in your area
- Gives advice on how to deal with the natural disaster/storms in an easy-to-understand format once it is close to reaching your area

Nice to have, but not MVP

- Notifications about international weather news

Key assumptions to test

- Make sure the notifications pop up with no delay
- Make sure the advice notification pop-up on how to deal with the disaster(s) is informative, yet easy to understand
- Make sure the alarm actually plays once the natural disaster makes landfall and explains what the disaster is.
- Make sure the alarm doesn't play on non-emergency cases (normal rain storms, snow, etc.)
